Course Code: CSA20001

Introduction

In today's digital age, people are surrounded by endless entertainment options, especially movies. Choosing what to watch often becomes confusing and time-consuming. This project presents a simple yet intelligent movie recommendation system that helps users discover movies based on their preferences, mood, and past ratings.

The system is not built using complex machine learning models but instead uses a rule-based approach combined with basic natural language processing techniques. Even with this simplicity, it still manages to give meaningful and personalized recommendations.

The goal of this project is to demonstrate how user behavior and preferences can be analyzed to simulate an intelligent system.

Objective of the Project

The main objectives of this project are:

- To design a system that recommends movies based on user input
- To understand how preference-based filtering works
- To implement a simple AI logic without using heavy libraries
- To create a user-friendly interactive program
- To analyze how mood, genres, and ratings affect recommendations

Problem Statement

With so many movies available, users often struggle to decide what to watch. Most platforms use advanced AI systems, but this project focuses on building a lightweight version that still captures user taste effectively.

The challenge here was:

- How to understand user preferences
- How to rank movies intelligently
- How to generate meaningful recommendations without machine learning

Features of the System

- Personalized recommendations
- Mood-based filtering
- Keyword-based understanding
- Interactive user input
- Explanation for each recommendation
- Simple and efficient logic

Future Improvements

This system can be improved by:

- Adding a larger movie database
- Using machine learning algorithms
- Connecting with APIs like IMDb or TMDB
- Adding user history tracking
- Improving keyword extraction using NLP libraries

Conclusion

This project successfully demonstrates how a basic AI system can be built using simple programming techniques. Even without advanced machine learning, it is possible to create meaningful and personalized recommendations.

It gives a strong foundation for understanding recommendation systems and shows how user data can be transformed into useful suggestions.

Overall, this project is a great starting point for anyone interested in AI, data processing, and real-world applications.
